Supplementary file: Prediction of Protein—Protein Interaction based on Interaction-Specific Learning and Hierarchical Information

March 18, 2025

1 Case study on post-translational modification (ptm)

HI-PPI successfully identifies 9 ptm-mediated PPIs in the SHS27K dataset, while other state-of-the-art methods failed to do so. The details of these protein pairs are presented in Table S1.

Among the identified protein pairs, the frequently occurring protein ENSP00000215832 corresponds to GAPDH (Glyceraldehyde-3-Phosphate Dehydrogenase), a multifunctional protein involved in glycolysis, apoptosis, DNA repair, and transcriptional regulation. The prediction results further validate its central role in cellular signaling and stress responses. Other proteins in the predicted pairs, such as ENSP00000250971 (Epidermal Growth Factor Receptor, EGFR) and ENSP0000005257 (Breast Cancer Type 1 Susceptibility Protein, BRCA1), are well-known for their implications in diseases, including cancer, neurodegenerative disorders, and metabolic syndromes. These predictions have the potential to uncover novel therapeutic targets or biomarkers for these conditions.

Furthermore, ptm-mediated interactions are often dysregulated in diseases, making them highly attractive targets for drug development. The prediction results from HI-PPI can significantly contribute to the identification of novel drug targets or mechanisms of action, thereby advancing therapeutic strategies.

Table S1: The protein pairs related to ptm PPIs that only identified by HI-PPI
